Results of 2008

Two-page Summary

1. Country: GREECE

1.1. Summary of Results

A total number of 2455 surveillance samples were analysed by 9 laboratories, including 2229 samples of fresh and frozen fruit and vegetables, 63 of cereals, 148 of processed products and 15 of baby food. Furthermore, 41 follow up samples were also examined.

Fresh and frozen fruit and vegetables: A total of 2229 surveillance samples were examined [1893 (84.9%) were domestic samples of fruit and vegetables, 22 (1%) were samples from other EU countries and 314 (14.1%) were imported samples from TCs].

- 1830 (82.1%) were samples without detectable residues
 - 326 (14.6%) contained detectable residues at or below MRLs
 - 73 (3.3%) contained residues of one or more pesticides at concentrations above the MRLs
- The total number of pesticides sought in fresh fruits and vegetables was 215. The most frequently pesticides found in fresh fruits and vegetables were chlorpyrifos, iprodione, bifenthrin, phosmet, phosalone, cypermethrin and endosulfan

Cereals: A total of 63 surveillance samples were examined [23 (36.5%) were domestic samples and 40 (63.5%) were imported from TCs].

- 62 (98.4%) were samples without detectable residues
- No samples contained detectable residues at or below MRLs
- 1 (1.6 %) contained residues above MRLs

The total number of pesticides sought in cereals was 79. The only pesticides found in cereals were malathion and endosulfan..

Processed products: A total of 148 samples were examined [146 (98.6%) were domestic samples and 2 (1.4%) were imported from other TCs].

- 113 (76.4%) were samples without detectable residues
- 35 (23.6%) contained detectable residues at or below MRLs
- No samples contained residues above MRLs

Baby Food: A total of 15 surveillance samples were analysed. All of them (100 %) were samples without detectable residues.

1.2. Organisation of monitoring programmes and Sampling

1.2.1. Responsibilities

The multi-annual and annual monitoring programmes were designed and organised by the CCA. The responsibilities of the laboratories involved, regarding the number of samples of each commodity that should be analysed and the areas of sampling were well defined by this program. The responsible for the EU co-ordinated program laboratories were clearly stated. The sampling is carried out by the responsible for sampling regional and local authorities

1.2.2. Design of Programmes (priorities, targeting, criteria for the percentage of samples to be taken from the organic sector)

The program was designed based on several risk analysis criteria and parameters (number of samples for each commodity, produce, cultivation area, possible imported products, products

with exceedances from previous years, daily dietary intake contribution of each commodity, sampling location, pesticides used in practice, analytical capacity of each laboratory).

1.2.3. Sampling: personnel, procedures, sampling points

The responsible for sampling authorities, with the designated personnel, follow the methods of sampling (Commission Directive 2002/63/EC). Samples were taken from “the farm to the fork” (points of entry, wholesalers, retailers, farm gates etc.).

1.2.4. Enforcement action

In the case of an MRL infringement, the relevant to the case enforcement actions specified by national law are taken.

1.3. Quality assurance

1.3.1. Status of accreditation of laboratories, number of laboratories

Official laboratories involved in the pesticide monitoring program of 2008 were either accredited or in the final stage of accreditation (waiting for the certificate).

1.3.2. Analytical methods used

Dutch multi-residue method, MA-01, MA-02, Dithiocarbamates UV-determination, ELOT EN 12396-1:1999, Lentza-Rizos and E.J. Avramides, Analyst 1990-vol. 115.

1.3.3. Participation in proficiency tests

EUPT-SRM3, EUPT FV-10, EUPT FV-11

1.3.4. Implementation of EU quality control procedures

The EC guidelines of the quality control procedures for pesticide residue analysis are followed as close as possible.

1.3.5. Analytical uncertainty

The pesticide residues figures found are compared with the MRLs. However, in a case of an exceedance of the MRL, before any administrative and punitive enforcement action is taken, a default analytical uncertainty of 50% is subtracted from the measured value. If this figure still exceeds the MRL, enforcement action relevant to the case is taken.

1.4. Other information

In all cases of MRL exceedances, risk assessment for acute exposure is conducted, using the ARfD value. In the cases of pesticides that an ARfD has not been set, the ADI is used.
